

EDUCATION**University of Wisconsin–Madison**

M.S., Economics; 3.50/4.00 GPA

May 2024

B.A., Economics; 3.32/4.00 GPA (3.51 Major)

May 2021

RESEARCH EXPERIENCE**Korea SMEs and Startups Institute****Seoul, Korea**

RA to Sunyoung Han

June 2026 – Present

- Surveyed prior studies and produced summary statistics on the effects of SME policy support on firm performance
- Assisted in the analysis of how policy support affects firms' likelihood of transitioning into zombie firms
- Built and analyzed restricted government microdata at Statistics Korea's Data Center to establish criteria for micro-enterprises

Center for Research on the Wisconsin Economy (CROWE)**Madison, WI**

RA to Kim Ruhl

January – May 2024

- Co-authored "[Wisconsin's Share of Federal Contract Dollars, 2021–23](#)" (CROWE, 2024) with J. Pulley and A. Fos, analyzing federal contract obligations by sector, awarding agency, and recipient firm across Midwest states
- Assessed federal grant allocation across Midwest university systems, comparing totals against grants per FTE student

University of Wisconsin–Madison**Madison, WI**

RA to Paolo Martellini

January – August 2023

- Built a parcel-level dataset matching property-sales and tax-assessment records to analyze the relationship between urban regulation, property taxes, and home prices
- Identified discrepancies between assessed values and transaction prices, used for estimating effective property-tax burdens

Institute for Development and Human Security (IDHS)**Seoul, Korea**

RA to Eun Mee Kim

May – August 2017

- Analyzed Official Development Assistance (ODA) in OECD countries and contributed to global health strategy reports

RESEARCH PROJECTS**[Reassessing Spatial Labor Misallocation: A Decade Beyond Hsieh and Moretti \(2019\)](#)****M.S. Thesis**

Extended Hsieh and Moretti's (2019) analysis period to 1964–2019, constructing a panel of 274 MSAs and examining changes in the distributions of land-use regulation, housing costs, and employment through kernel density estimation. Identified that the original counterfactual does not incorporate the feedback between wages and labor allocation, leaving indirect utility unequal across cities, and re-estimated it by iterating to a fixed point. The estimated output-growth effect for 1964–2009 was 15.6 percentage points rather than the original 103.5, shrinking further to 7.7 points for 1964–2019. Fixing housing costs at their 2009 level lowered the growth rate by 13.9 points, confirming that recent deregulation has eased spatial labor misallocation.

[Spatiotemporal Analysis of Ridesharing and Crime in Chicago](#)**Honors Thesis**

Combined Chicago's 2019 ridesharing and taxi trip records with crime data to build a panel of 77 communities $\times$ 8,760 hours — 674,520 observations from over 107 million raw records. Attempted a 2SLS design using air quality as an instrument for trip demand to address reverse causality; as the instrument lacked power at the city level, estimated models with area and time fixed effects instead. Ridesharing volume showed a positive association with sexual-crime rates, stronger in areas with heavy taxi activity — contradicting prior citywide findings that Uber's introduction reduced sexual crime.

SKILLS & CERTIFICATE

US CPA — 1 of 4 sections passed (FAR)

HBS Online — Big Data for Social Good, completed February 2022

SAS, Python
